Lunch
Open Grille/Hamburgers
and Hot Dogs

This modern, barn-style home will be passively heated and cooled and use just 17% of the total energy when compared to the conventional three-bedroom, two-bath home. A home-of-the-future prototype, developed with financial support from the New York State Energy Research and Development Authority, The Hudson Passive Project will be completed Fall, 2010 in Claverack, New York, in the heart of the Hudson Valley.

All who contributed to The Hudson Passive Project believe that by encouraging innovative, energy efficient and enduring homes today, we can help assure a greener, more sustainable planet for tomorrow. Few realize that nearly as much energy is used in our nation's homes as in our factories. As homeowners, designers, and builders, we know we can do more to save our natural resources than otherwise thought possible.

For more information on The Hudson Passive Project visit www.thegoodhome.com; we'd love to make you part of the > Good Home Movement.
